Postprandial glucose level is a screening test for Diabetes Mellitus

• If glucose level is >140 mg/dL and <200 mg/dL, then GTT (glucose tolerance test) is advised.

• If level after 2 hours = >200 mg/dL diabetes mellitus is confirmed.

• Advise HbA1c for further evaluation.

Glycated hemoglobins (GHb), also called glycohemoglobins, are substances formed when glucose binds to hemoglobin, and occur in amounts proportional to the concentration of serum glucose. Since red blood cells survive an average of 120 days, the measurement of GHb provides an index of a person's average blood glucose concentration (glycemia) during the preceding 2-3 months. Normally, only 4% to 6% of hemoglobin is bound to glucose, while elevated glycohemoglobin levels are seen in diabetes and other hyperglycemic states Mean Plasma Glucose(MPG): This Is Mathematical Calculations Where Glycated Hb Can Be Correlated With Daily Mean Plasma Glucose Level

INTERPRETATION Method: Analyzer Fully automated HPLC platform. HbA1c values of 5.0- 6.5 percent indicate good control or an increased Average Level of Hemoglobin A1c risk for developing diabetes mellitus. HbA1c values greater than 6.5 Blood Glucose(eAG) Control (%) percent are diagnostic of diabetes mellitus. Diagnosis should be (mg/dL) confirmed by repeating the HbA1c test. 421 14% 386 13% 350 L 12% E 314 11% R 279 10% Т 243 9% 208 8% 172 POOR 7% 136 GOOD 6% 101 5% NOTE: Hb F higher than 10 percent of total Hb may yield falsely low results. Conditions that shorten red cell survival, such as the presence of unstable hemoglobins like Hb SS, Hb CC, and Hb SC, or other causes of hemolytic anemia may yield falsely low results. Iron deficiency anemia may yield falsely high results.
